RACGP - Peripheral arterial disease - diagnosis and management in general practice

The most common symptom of peripheral artery disease in the lower limb is claudication. The symptoms severely limit both exercise performance and walking ability. published practice guidelines of the Society for Vascular Surgery [8].

Peripheral artery disease is one of the most prevalent conditions, and it frequently presents with critical limb ischemia (i.e., with rest pain or trophic changes). Clinical practice has demonstrated the multisystemic involvement of the vascular system.

About half the people diagnosed with PVD are symptom free. For those with symptoms, the most common first symptom is painful leg cramping that occurs with exercise.
