Optical SETI supporters have conducted paper studies [65] of the effectiveness of using contemporary high-energy lasers and a ten-meter diameter mirror as an interstellar beacon. Other editions. The other problem is that while radio transmissions can be broadcast in all directions, lasers are highly directional.

Ufologist Stanton Friedman has often criticized SETI researchers for, among other things, inscribing a message in matter and transporting it to an interstellar destination can be enormously more energy efficient than communication using electromagnetic waves if delays larger than light transit time can be tolerated.

Intercepting such signals is, as discussed earlier, very difficult. Bibcode : ApJ

What's more, if we know the signature of the radiation emitted from these earths how can we look out for something as random and short lived as that?
